MONTREAL.

Successors to EWING BROTHERS.

AB 15000

EWING'S SEED WAREHOUSE,

142 AND 144 McGILL STREET,

MONTREAL.

WE have much pleasure in presenting our annual ILLUSTRATED CATALOGUE of

GARDEN, FARM AND FLOWER SEEDS;

and in doing so solicit a continuance of your valued orders.

VEGETABLE SEEDS.

The many varieties of these have been selected with the greatest care, our long and practical experience enabling us to know just the most suitable varieties for either the Market Gardener or Amateur.

FLOWER SEEDS.

The assortment we offer is extensive and well selected. No useless things are enumerated, and intending purchasers may rely on us supplying them with as good Flower Seeds as it is possible to obtain.

AGRICULTURAL SEEDS.

This department being so important, great care will always be taken to supply Farmers with pure and reliable Seeds and Grain. At page 31 will be found enumerated the most useful Grasses for Pasture and for Hay.

We test the growth of all our seeds, and do not send out unless satisfactory, and take every precaution to supply reliable Seeds; but we give no warranty as to quality or description of any seeds we send out, and will not be in any way liable for loss arising from failure thereof, or responsible in any way for the crop, and all Seeds bought from us must be accepted on these terms, or returned. It is a fact of which farmers and gardeners are well aware that sometimes Seeds do not germinate, and that crops fail to mature from causes which it is impossible to account for, or which, at all events, cannot be prevented.

We solicit orders, and promise prompt and careful attention.

WILLIAM EWING & CO.,

Successors to Ewing Brothers.

142 McGill Street, Montreal, 1st January, 1884.

CABBAGE.

(FR. CHOU POMME,)

Early Standard Cabb

OW ear'y sorts in hot-beds in March. and be careful to give plenty of air. By transplanting into a cold frame, nice "stocky" plants can be had for planting out; but if this is not convenient, the young plants must be well thinned out. Late varieties may be sown in the open ground, in beginning of May, in a damp and somewhat 'shaded position. Transplant on a cloudy or rainy day into rich ground, in rows, allowing plants 11/2 to 3 feet each way, according to size of variety' Per oz. Per pkt.

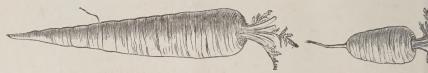

Early Standard Cabbage.	Per oz.	Per pk
Early Standard—This new variety continues to give unbounded satisfac-		
tion. It is from ten days to a fortnight earlier than the Ox-heart (which		
used to be the favourite sort in the Montreal market); produces firm		
heads resembling the best type of Ox-heart, but both the heads and the	13	
outer leaves are larger. We recommend it strongly to all gardeners		
who wish to make money by Early Cabbage		Iọc.
Early Etampes-This is a very early sort, and, like the preceding, is of		
the Ox-heart type	50	10
Little Pixie—Dwarf, early, and of delicate flavour		5
Early Jersey Wakefield—Very early, large and solid. The favourite early sort in the United States. American-saved seed		Io
Large Early Conical—An early sort, with solid pointed heads		10
Early York. Both good sorts, the first being very early	15	5
Sugar Loaf—Heads are of conical shape, second early	20	5
Large Ox-Heart -A fine flavoured early sort, heads large and firm, and		
suitable for market gardeners. Our stock of this favourite variety has		
been carefully selected	20	5
comes in just after the Standard. We advise gardeners to cultivate a		
proportion of this sort		IO
Filderkraut—Solid conical shaped heads; second early	20	5
Winningstadt-A good sort for general cultivation, producing very solid		
pointed heads; second early	20	5
St. John's Day Early Drumhead. Fine French late	2	5
" Late " varieties, St. Denis,	15	5
St. Denis Large being the most solid,	20	5
Quintal or cwt. is the best keeper	20	5
Large Late Drumhead—A medium-size late variety	15	5
Fottler's Improved Brunswick—This variety has a fine, large, solid		
head. If planted early, will be ready for use in August, and it can		
also be used as a winter cabbage. We strongly recommend it to		
market gardeners, both for fall sale and keeping through the winter.		Io
Large White Schweinfurt Quintal-A fine summer and autumn		
sort; is the largest second early variety in cultivation	20	5
Large Brunswick Short Stem-Used as a second early and late		
variety, and produces very large and solid heads	20	5

CABBAGE—(Continued.)

See Agricultural Seeds for other varieties.

CAULIFLOWER.

Man de la constant de

(FR. CHOU FLEUR.)

grow this vegetable to perfection the soil must be rich, a good space (24 inches or so) allowed to each plant, and liquid manure liberally applied. Sow in March in hot beds, or in May in the open ground, and when plants are strong enough to lift, transplant into rows two feet apart. Our summer weather being so hot, early planting is not to be commended; it is very noticeable that the best heads are generally the latest.

Lenormand Cauliflower.

	Per oz.	Per pk
Early London-Well known early sort	, 50c.	Ioc
Early Paris-Earlier than preceding variety	51.25	25
Half Early Paris-A good variety for general crop; large flower	1.00	25
Dwarf Erfurt—The earliest sort; pure white flower; best for forcing		25

Late London Large and hardy; late. Walcheren	50	10
Autumn Giant—A good late sort		25
Abyssinian—Is a sure cropper, and produces very fine pure white heads;		
second early. This variety is the best for late fall crop, and is the		
favourite with Montreal market gardeners		25

CARDOON.

CELERY.

(FR. CELERI.)

T is best to sow in a hot bed in March or April, but if in the open air, about the middle of May, covering seed very lightly, and shading until the plants are strong. When plants are fit to handle, transplant into a well-prepared bed, and carefully protect from frost. In July again transplant into a trench fifteen inches deep and a foot wide, into the bottom of which a good quantity of thoroughly decayed manure has been previously dug and covered with rich mould. Plant two straight rows in the bottom of the trench, allowing six or eight inches between each plant, and give plenty of water in dry weather. After the plants have grown for some time, earth up for blanching-performing this operation in dry weather, and being careful to keep the hearts free from soil. Store in a cool cellar for winter use.

Dwarf Large-Ribbed Celery.		
	Per oz.	Per pkt.
Dwarf Large Ribbed-A fine flavoured solid sort, which requires		
little earthing up. We strongly recommend this variety to market		
gardeners		5

LETTUCE.

(FR. LAITUE.)

O secure a succession of this favourite Salad, make the first sowing in a hot bed in March, transplanting into another bed when plants are fit to handle. For open ground culture, make first sowing as soon as the ground is free from frost, and continue at intervals until August. Seed should be covered very slightly, and plants set out one foot apart. To grow Lettuce well, they must be grown quickly, and hence rich free soil and frequent watering are indispensable.

Cabbage Varieties:-

	Per oz. F	er nkt
White Summer—A crisp, mild-flavoured variety	. I5cts.	. 5cts.

Finely cut leaves; valuable for garnishing.. 30

Giant Curled..... 50

PEAS.

(FR. Pois.)

AKE the first sowing as soon as ground can be wrought, using one of the earliest smooth sorts, as the wrinkled varieties will neither stand frost nor grow if the ground be cold and wet. Soil should be rich and well trenched, and new manure should never be used for this crop. Sow in double rows, nine inches apart, and range stakes alongside as they grow, unless in this case of the DWARF SORTS, which, of course, require no stakes. There should be a space of two to four feet (according to height of variety) allowed between each double row. In a wet season, or in very rich soil, Peas may grow very much taller than the heights we mention. One pound will sow 40 to 60 feet of a row, according to size of pea.

PEAS—(Continued.)

THE CONTRACTOR

TTE keep the leading varieties in stock.

RHUBARB.

(FR. RHUBARBE.)

OW seed in May, and the succeeding Spring transplant into deeply trenched and heavily manured soil, leaving three feet between plants. Every Fall the Rhubarb beds should receive a heavy dressing of manure.

RADISH.

(FR. RADIS.)

AY be sown any time throughout the Spring and Summer months; the earlier sowings in February and March should be in a medium hot-bed. Should never be allowed to grow too thick, as this renders the roots tough and stringy; should be copiously watered in dry weather to promote rapid growth, thus securing tender bulbs. Will succeed well in any rich garden soil, not over moist or too heavy. In the open ground, sow in drills ten or twelve inches apart, and thin out to two or three inches.

TOBACCO.

(FR. TABAC.)

OW in March in a hot bed, and prick out into a cold frame in April, or it can be raised in a shallow box in the house. In May, again transplant into rows three feet apart each way; soil should be rich. Pick off flowers and side shoots as they appear.

> Havana, Virginia, Marvland, Connecticut and Ohio. All at 5 Cents per Packet.

TURNIP.

(FR. NAVET.)

MHE early varieties may be sown as soon as the state of the ground will allow, in drills, one and a half feet apart, and the plants thinned out to nine inches. Make successive sowings of early sorts until the end of July, so as to have nice tender bulbs all the season. The situation should be a warm border for the earlier sowings. The Swedish varieties are most suitable for storing through Winter, and need not be sown till beginning of June.

Green Top Swede-

Laing's Purple Top Swede-Sweet German Swede-East Lothian Hybrid Swede-Iocts. 5 cts. Robertson's Golden Ball-The best of the yellows for general crop, is a quick growing and a good keeping sort IO Altringham Yellow-Small size; good for early or late sowing Early Stone-Matures quickly, and is valuable for late sowing White Dutch—Very fine and juicy; best for early sowing....... American Red Top-Strap Leaved) Both fine sorts, of quick growth and good quality

SWEET AND POT HERBS.

5

Purple-Top Early Munich—The earliest sort yet introduced

OW early in Spring, in a corner by themselves. They are for the most part perennials, and also mul iply from the see I they drop. Thin out the young plants thus raised, and keep the beds free from weeds. Should be harvested in dry weather and dried in the shade. Herb seeds are mostly very fine, so that care is necessary in sowing.

Angelica, Anise, Balm, Sweet Bazil, Bush Bazil, Borage, Coriander, Carraway, Fennel, Fænugreek, Henbane, Hyssop, Horehound, Sweet Marjoram, Pot Marjoram, Pot Marigold, Saffron, Sage, Summer Savoury, Winter Savoury, Sorrel, Scariole, Thyme, Wormwood.

All at 5 Cents per Packet.

AGRICULTURAL SEEDS.

E offer a large and carefully selected stock of Farm Seeds. We procure the best seeds, irrespective of price, and the yearly increase in this branch of our business shows the thoroughly reliable character of the seeds we supply. The sowing of the best quality of seed is of the utmost importance, but the farmer has to do his part also, and success with root crops need not be expected unless the land be thoroughly and deeply cultivated, and from twenty to thirty loads of stable manure (or its equivalent in artificial manures) applied per acre.

BEET.

ESIDES being grown for sugar manufacture, it is now used extensively for feeding purposes. The large amount of sugar it contains has induced many to use it for fattening stock in preference to Mangel.

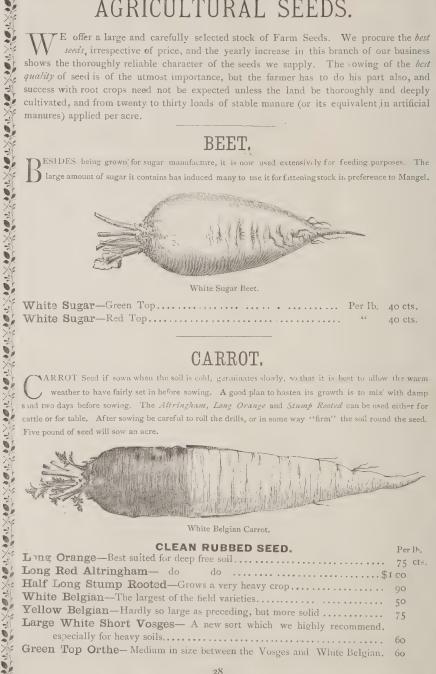

White Sugar Beet,

White	Sugar—Green Top	Per lb.	40 cts.
	Sugar—Red Top		40 cts.

CARROT.

ARROT Seed if sown when the soil is cold, germinates slowly, so that it is best to allow the warm weather to have fairly set in before sowing. A good plan to hasten its growth is to mix with damp s and two days before sowing. The Altringham, Long Orange and Stump Rooted can be used either for cattle or for table. After sowing be careful to roll the drills, or in some way "firm" the soil round the seed. Five pound of seed will sow an acre.

Green Top Orthe-Medium in size between the Vosges and White Relgian	60	

MANGEL.

NHIS root thrives best in dry climates, such as ours is, and is comparatively free from the risks attending Turnip culture. Do not sow till middle of May, as the least frost will kill the young plants. Sow in drills, at least two feet apart, and leave 15 to 18 inches between the plants. Ground should be well wrought and heavily manured the previous Fall, and ploughed again in Spring. Mangel grows well on either deep or shallow soils, long varieties being best suited for the former, and the Globe for the latter, while the Oval and Oberndorf will yield a splendid crop on either. Sow five pounds of seed to the acre

GRASSES.

FOR PASTURE AND HAY.

THERE is no branch of Agriculture that has received so little attention in the Dominion as the cultivation of Grasses and the forming of permanent pasture, and there is no department of agriculture that would pay our farmers better to attend to than this.

The European demand for butter and cheese, at least for good qualities of those articles, is constantly on the increase. The possibilities of the trade are therefore very great, and it is no exaggeration to say that double the number of cows could be profitably kept on a given number of acres of good grass land, than on the ordinary pastures of the country, if farmers would only use the same industry and intelligence in "making" pasture land, and in growing the various forage plants, as they do in raising crops of Wheat, Barley or Oats; and we are sure that in the Eastern Provinces the former system would be the most profitable. We do not mean to say that there are no farmers who pay attention to growing grass, but they are the exception; when you find one, however, you can rest assured that he is rapidly making money.

To have the Dairy Department of Farming as remunerative as it should be, it is an absolute necessity to have good pasture. It is true that many of the best grasses are indigenous, that is, they will be found in the course of time in pasture, though not sown, but this will only happen when the land has been well taken care of. Timothy and clover, though very suitable for hay, do not form a close sod, and consequently should not be used alone if it is desired to have pasture.

We therefore strongly recommend that a mixture of a number of varieties of grasses and clovers should be sown, because there is not a month from spring till fall, but is the season of luxuriance of one or other of them, and it is only by sowing a variety of species that a close sward can be formed in the shortest time.

Below we enumerate most of the leading Grasses with descriptive remarks, which we hope may be useful.

Some of our best farmers are now using Orchard grass, instead of Timothy, for hay, and find it very profitable.

We hope that all our customers will make a trial of sowing a mixture of grasses this season, and we will be happy to give particulars as to price, what sorts are best adapted for particular soils, and any other information we have regarding the various varieties.

The average weight, per bushel, of grasses, excepting Timothy and Rye Grass, is about 14 lbs.

Timothy—(Phleum pratense)

May be said to be (along with Clover) the exclusive hay crop of Canada, and is much relished by every kind of stock, though it is better acapted for horses than horned cattle; it succeeds best on clay soils, or moist, heavy loams. Only a small proportion of it should be used in a mixture of pasture grasses. Price

Kentucky Blue—(Poa pratensis)

Good either for hay or pasture, and grows better on dry gravelly soil than almost any other variety of grass. Yields a large quantity of herbage very early in the eason, and, when intended for hay, should be cut when in flower.

Orchard—(Dactylus glomerata)

A valuable grass for hay, on account of its large yield, and of its ripening at the same time as clover. Is remarkable for its rapid growth after being eaten or cut, and is said to produce more pasture per acre than any other grass. Is not suitable for thin soils, but grows well under the shade of trees.

Red Top—(Agrostis vulgaris)

A native variety of grass, suitable for permanent pasture; forms a close sod, and succeeds best on moist soils. Should be kept eaten close, so as to prevent it running to seed, which renders it unpalatable to stock.

Meadow Foxtail—(Alopecurus pratensis)

A fine early grass for permanent pasture, producing a fine, close sod. Is not so suitable for hay, as the stalks are not numerous, and succeeds best on moderately moist land.

Crested Dogstail—(Cynosurus cristatus)

45c. per lb.

Only useful for pasture, and thrives well on almost any sort of soil. The flower stalks are not eaten by cattle, but all animals are fond of the root leaves, which are produced in great abundance.

Sheep's Fescue—(Festuca ovina)

25c. per lb.

Best suited for gravelly or sandy soils. It grows in small tufts, and a small proportion of it is of great advantage in permanent pasture, especially where sheep are kept.

Hard Fescue—(Festuca Duriuscula)

Is a fine pasture grass, and does well in most kinds of soil, but especially on such as are light and dry. It is of dwarf habit, with fine foliage, and forms a close sod, thriving well in the driest weather.

Sweet Vernal—(Anthoxanthum Odoratum)

The main utility of this grass is its earliness and its continued growth till late in the Fall, notwithstand-

Meadow Fescue—(Festuca pratensis)

Succeeds best on moist loamy soils, makes excellent hay or pasture, and is much relished by cattle. This is one of the very best of the natural grasses. If used as hay must be cut before the seed is ripe. Wood Meadow—(Poa nemoralis)

Is suited to almost any variety of soil, and succeeds letter under the shade of trees than any other variety. Good either for hay or pasture, but its main advantage is its earliness.

Yellow Oat Grass—(Avena Flavescens)

Aira Flexuosa—A valuable grass for gravelly soils.

Italian Rye Grass-(Lolium Italicum)

Used greatly in Europe for cutting green, and where sewage irrigation is practised immense yields have been secured. It is not uniformly hardy in our climate.

English Rye Grass-

20c. per lb.

Is the staple variety used for hay in Britain, as Timothy is in this country. A portion may be used in mixtures, on account of its early and strong growth.

Grasses in mixture for pasture and hav.

14c. to 20c. per lb.

FINEST MIXED GRASSES.

FOR LAWNS, &c.

UR mixture of Lawn Grass we confidently recommend as being suitable for our climate. We only use the finer varieties of grasses, such as grow low and compact, and which will, with care, produce a fine, close, velvety lawn. The ground to be sown should be deeply dug and evenly raked, and only OLD manure used. The seed should be raked in very lightly, and afterwards rolled or beat down with the back of Per lb. 30 cents. the spade. About 40 pound of seed is sufficient for one acre.

CLOVERS.

700 700 700 700 700 700 700 700 700

The White Dutch and Yellow are only used for pasture. The Late Red, Rawdon Red (which are the strongest growing), and Alsike, are best for hay, while the Western Red, which is not tall, is mostly used for pasture. It is of great advantage to sow Red Clover alone—at the rate of say 15 lbs. to the acre, and plough in the second year. Some recommend ploughing in the crop green, but as good a plan is to cut the first crop in July and pasture the second in the fall. It has been estimated that the roots of a good stand of clover have as much manurial value per acre as twenty-five loads of stable manure.

Western Red. Yellow.

FORAGE PLANTS.

FOR SOILING.

In these months even good pastures are nearly always dried up, while on the average pastures of the country there is nothing for the cattle to eat at all, and as a consequence cows go nearly dry.

The most of these Forage plants, being of Tropical growth, will flourish, it don't matter how hot the weather is, and therefore the farmer who sows a patch of Corn, Tares or Hungarian Grass, is to a certain extent independent of dry seasons and ruined pastures.

A comparative statement of the value of the different methods of soiling cattle (that is feeding them altogether in the stable with green food) or pasturing, is beyond the limits of our space, but certainly a partial following of the soiling system is the wisest course that a farmer can pursue in this country of hot dry summers. The ground intended to be sown for forage must be well manured and thoroughly cultivated. Weekly sowings should be made so as to afford a succession, and thus everything can be fed when at its fittest—this is important.

Horse Tooth Corn. Evergreen Sugar Corn. Hungarian Grass. Millet. Sainfoin.
Lucerne Clover.
Tares.
Amber Sugar Cane.

GRAIN.

Beans, Barley, Buckwheat, Indian Corn, Linseed, Peas, Oats, and Wheat.

Imported and home grown, carefully selected and of the best sorts.

The benefit to be derived from change of seed grain is certain, and the change should, if possible, be secured from a different character of soil than that on which it is intended to be sown. Samples and prices forwarded on application.

FLOWER SEEDS.

\$@\\X\$@\\X\$@\\X\$@\\X\$@\\X\$@\\X\$@\\

Flower Seeds in any quantity we forward post paid.

The following hints regarding the cultivation of Flowers may be of some service to Amateurs:

- SOIL.—A free, medium rich soil, produces the best Flowers. If the soil be poor the plants, will not last long in bloom; while if too rich there will be an overgrowth of leaves but few flowers.
- SOWING.—In the open ground, never sow too early. The plants flower much better if the seed be sown when the temperature of the soil is warm. The ground should be dug deeply, and carefully raked over; small seeds should have the least possible covering—larger ones a little more in proportion to their size; after sowing, the ground should be pressed down with the hand.
- THINNING AND STAKING.—When sufficiently advanced to handle, the plants must be thinned out to a proper distance from each other, so that each plant will have plenty of room and air: the taller sorts, some of which have weak stems, should be supported by straight wooden stakes, and the plants secured to those by a narrow strip of matting.
- TRANSPLANTING.—This operation should be done, if possible, when the weather is cloudy. Great care should be taken to preserve the roots entire, and with as much earth adhering to them as possible; thoroughly drench the plants before lifting to effect this. Plant rather thick to allow for failures, and water copicusly in the evenings, if the weather be dry.
- ARRANGEMENT.—In sowing or planting, special attention should be paid to the height of the plants, so as to have the smallest in front of the bed or border, and the taller ones in rear. Care should be taken to have a contrast of colours, otherwise the effect will not be pleasing. When grown in "Masses" or "Ribbons" Annuals should completely cover the ground. In small gardens, however, where they are sown in a mixed bed or border, it is best to let every plant or patch form a distinct object of attraction.
- TENDER ANNUALS.—Half Hardy and Tender Annuals require much the same after-treatment as the hardy varieties. They should be sown in a hot bed or in boxes in the house, In April, in light soil composed of leaf mould, loam, and river sand, in equal proportions. The amateur can place the boxes or pots in the window of any spare room, and great care must be taken to water sparingly in the earlier stages of growth. When the plants are two or three inches high transplant to where they are intended to bloom.
- BIENNIALS AND PERENNIALS.—Many varieties of these, Hardy, Half Hardy and Tender, will flower the first year, if sown at the same time as Annuals. To have them flower the succeeding year, the best time for sowing is, perhaps, the months of July or August, so that the hardy varieties may have acquired sufficient strength to stand the winter. By sowing at this time there will be a fine show of flowers the succeeding summer. All the hints given regarding the culture of Annuals are applicable to Biennials and Perennials.

CHOICE FLOWER SEEDS IN COLLECTIONS.

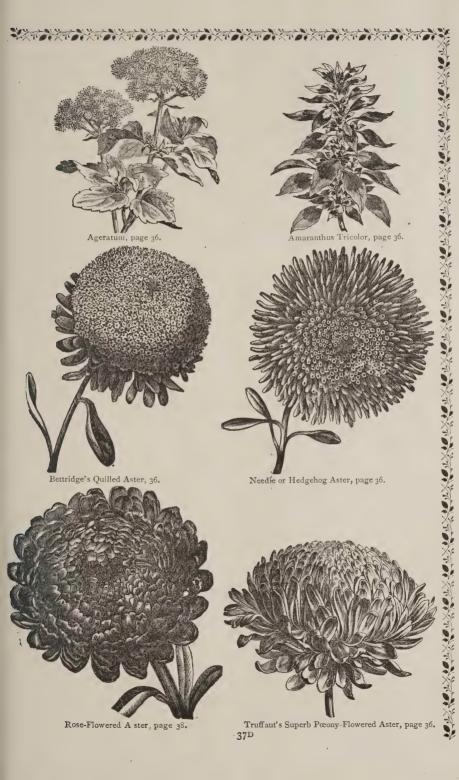

WM. EWING & CO. have much pleasure in inviting especial attention to the following assortments of Choice Flower Seeds. They have been selected with great care, from the most eminent growers, and are mostly in the original sealed packets as imported.

Agrostis Pulchella.

Gynerium Argenteum.

Per pkt,	Cts.
532-Eragrostis elegans, 1 foot	5
533—Erianthus ravennæ	25
A superb perennial grass, growing to feet in height; producing handsome feather-like plumes	
of silvery white.	
534—Cynerium argenteum, 10 feet	25
Is considered the finest of all Ornamental Grasses, but is not so hardy as the Erianthus,	
which it resembles.	
535—Hordeum jubatum, 2 feet	
536-Lagurus ovatus, hardy, 1 foot	5
537Pennisetum villosum, 2 feet	10
538Poa amabilis. New	10
539-Stipa pennata (Feather Grass), 11/2 feet; flowers second year	10

To make up bouquets of "Everlastings" it is necessary to have a few sorts of Ornamental Grasses to mix in with them, besides many of them look well in the mixed border, among bright flowering plants. All can be treated as hardy, with the exception of Erianthus, Gynerium, and Stipa. The first two require to be taken in-doors during Winter; the Stipa can be left out, but requires covering.

FOREST TREE SEEDS.

We have imported a few varieties of Tree seeds, thinking that the great interest that is now taken in this matter may induce a demand. Prices on application.

Russian Pine (Pinus Sylvestris), Himalaya Pine (Pinus Excelsa),

Ash Leaved Maple (Acer Negunda), Black Walnut,

Butter-nut and White Oak.

FLOWERING BULBS.

Gladiolus-Finest French Hybrids.

We strongly recommend this magnificent tribe of flowering bulbs, as, in any situation, their splendid tall flower spikes of brilliant colours render them special objects of attraction. The bulbs should be planted (covering them about four inches) in May; dry and somewhat sandy soil being the most suitable for their growth. They are generally placed in rows one foot apart, and nine inches between the bulbs, but may be planted in the mixed border in "clumps" of three or four. In Autumn, before frost sets in, lift the bulbs and remove to a dry cellar, or any other place free from frost, but still not too warm. We have a large and varied assortment for sale, but, instead of giving a full list of names and descriptions, we offer them in collections, as below. In the named collections we mark the colour on each variety.

tions, as below. In the named confections we mark the colour on each variety.

Green-House and Bedding Plants.

Of these we can offer a fine assortment of well-grown plants at moderate prices. Having the stock of six growers to select from it follows that we can execute a general order better than any one grower, for it is nearly a certainty that no grower's plants will be all equally excellent. We buy only the best from each, and thus are enabled to give the highest satisfaction to those favouring us w th their orders. Parties at a distance can rely on prompt attention to their commands, and that the packing will be carefully attended to, and boxes or baskets for packing charged at cost.

DOMINION LAWN MOWER.—This is a very simple and at the same time a very good Machine; has been used extensively during the past five Seasons, and has given great satisfaction.

EXCELSIOR LAWN MOWER.—Is a very popular Machine. It runs light, does not readily get out of order, is easily adjusted to cut high of low, and, on account of having a roller behind the knives, will cut borders.

We will also have for sale any Machine, showing decided improvements, which may be introduced during the season. All our Lawn Mowers are of Canadian Manufacture, and so any broken part can be got on short notice.
